Założenia:

$$f(a)f(b) < 0$$

$$\alpha \in [a, b]$$

Algorytm:

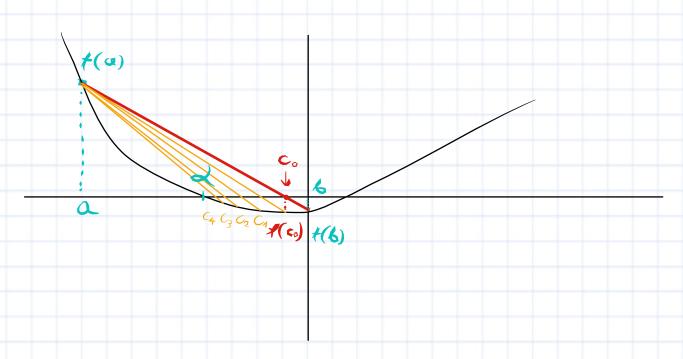

$$c = b - f(b) \frac{\left(b - a\right)}{f(b) - f(a)}$$

$$Je\dot{z}eli\ sgn(f(c_i)) = sgn(f(a_i))$$
:

$$a \leftarrow c$$

wpp.:

$$b \leftarrow c$$

Regula falsi jest zawsze zbieżna:

$$[a_n, b_n] \subset [a_{n-1}, b_{n-1}] \subset \dots \subset [a_0, b_0]$$
